A HANDY BOOK FOR THE CALCULATION OF STRAINS IN GIRDERS AND SIMILAR STRUCTURES AND THEIR STRENGTH, CONSISTING OF FORMUL

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 28 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1869 Excerpt: . . . at their apex by the secant of the angle they make with a vertical, or increase that shearing force in the proportion of the inclined, length of the bar to its vertical depth. Fig. 43. 108. Any lattice Repl. girder loaded on One Boom only. Booms. --If the load be concentrated, see 110. If distributed, place the diagram for the moments of rupture (4, 5) immediately above (or below) the outline sketch of the girder (59). Trace out the system of triangulation which terminates fairly at the extremity of the girder (see the thick lines in the fig.) To the curve of moments (4, 5) draw chords and tangents at points (K, D) corresponding to the divisions made by the triangles just traced out (D, E, fig. 43). If necessary for the construction, the diagram may be continued into the abutment. Two polygons will thus be formed, when, whatever be the number of systems of triangulation, --For the strain in any bay (84--87) of the unloaded boom take the ordinate, at the centre of that bay, to the circumscribed polygon; and for any bay of the loaded boom, to the inscribed polygon. If the ordinates represent the moments of rupture (4, 5, 97), divide their value by the depth of the girder (98). Web. --If the load be concentrated, see (110). If distributed, divide the load per unit of length (w) by the number of systems of triangles (the number of bays in the...
